Wetlands Program

Study Area

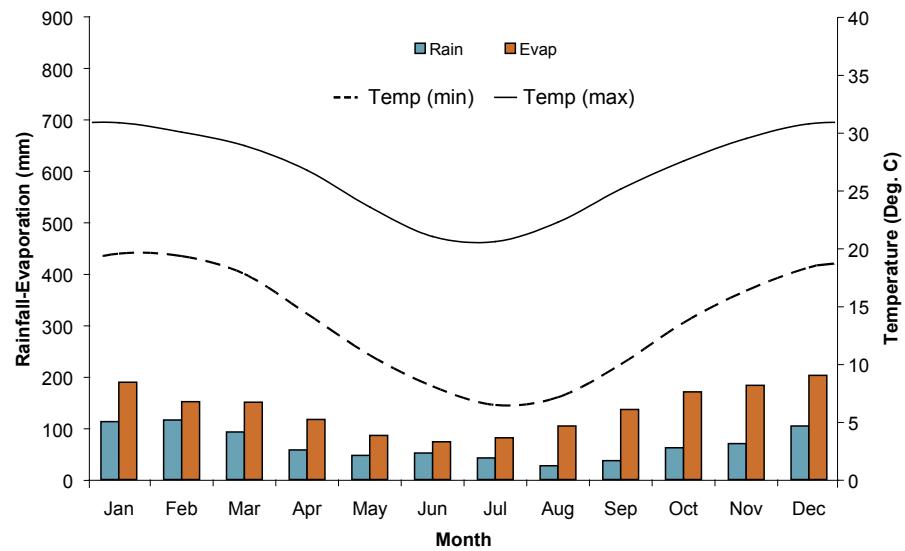

Wivenhoe Dam is located approximately 60 km north-west of Brisbane, South-East Queensland.

The dam was constructed in the 1980's for the purpose of water storage and flood mitigation in South-East Queensland. At the time of sampling the dam was at approximately 16% capacity.

Wivenhoe dam is an example of a an artificial freshwater wetland within the South-East Queensland Bioregion.

Climate¹

The study area is situated within a subtropical climatic region with a wet and dry season. Evaporation exceeds rainfall every month. The average annual rainfall for the area is 819 mm.

Landform and Inundation	Artificial dam on very gentle to very steep slopes Freshwater permanent inundation from overland flow
Soils ²	Hydrosols, Chromosols, Sodosols
Vegetation	Completely cleared
Geology ³	Esk formation - Shale, sandstone, conglomerate, tuff and coal
Disturbance	Highly disturbed area for urban water supply

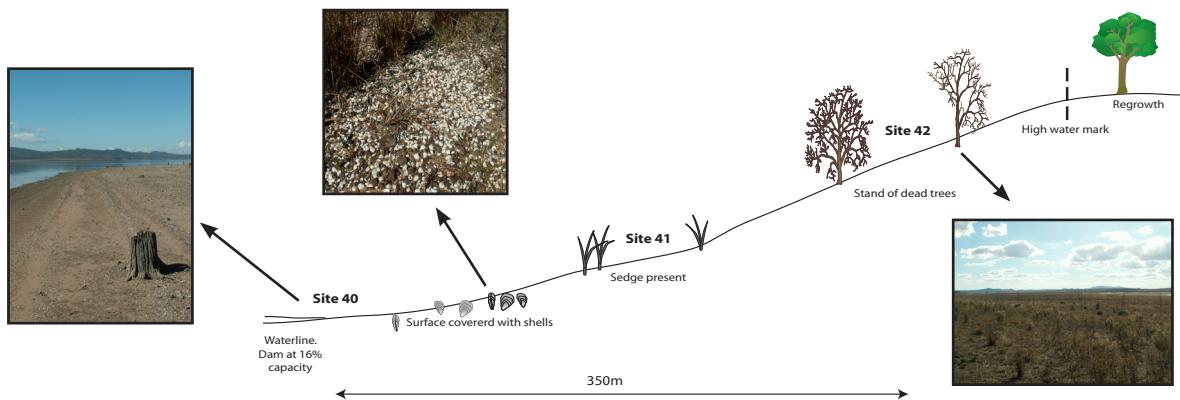

Location

GDA94 • MGA Coordinates : 459066 E, 6976369 N, Zone 56 • Lat/Long : -27.33520 S, 152.58619 E

*Aerial photograph on right was taken in 2002. At the time of sampling the water line was at site 40.

Landscape Diagram

Soil Profiles

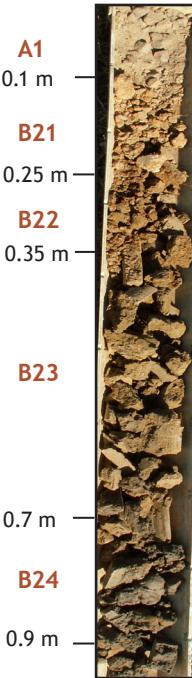

Site 40

Despite the lack of organic materials and the low organic carbon content, the gleyed matrix colour indicates that this profile is permanently saturated at 0.25 m

Mottling is indicative of water fluctuation within the surface horizons

Site 41

Presence of mottling indicates that there has been water fluctuation throughout the profile

Site 42

Mottling and presence of ferruginous root channel linings indicates that there has been water fluctuation throughout the profile

High chroma values and brighter soil colours indicate that the profile has not been reduced for a period of time

Soil Indicators Present (within 0.3 m of surface)

Indicator ⁴	Site 40	Site 41	Site 42
Organic materials and organic carbon (OC)*	No organic materials OC: 0.84%	No organic materials OC: 0.54%	No organic materials OC: 0.67%
Matrix colour	Brown to greenish grey	Olive brown to grey	Yellowish brown to brown
Chroma (thickness of layer)**	Present (0.05 m)	Present (0.2 m)	Not present
Mottles and Segregations	Very few <5 mm faint orange mottles Very few 5-15 mm faint orange mottles Few <5 mm distinct red mottles	Common 5-15 mm distinct orange mottles	Very few <5 mm distinct red mottles Few 5-15 mm faint red mottles
Depth to groundwater	Not present	Not present	Not present
Ferruginous root channel and pore linings	Not present	Not present	Present
pH ⁵	Moderately acid	Mildly alkaline	Moderately alkaline
Texture	Sandy clay loam to heavy clay	Clayey coarse sand to medium clay	Clayey coarse sand to heavy clay
Acid sulfate material	Not present	Not present	Not present
Electrical Conductivity (EC) ⁵	Non saline	Non saline	Non saline

*Organic carbon % (Dumas method) and pH taken from surface (0-0.1 m)

**Chroma value is less than or equal to 2

Summary of Field Observations

- Mottling was observed at all sites along the transect, this suggests that there has been water fluctuation throughout the profiles at some stage but some mottling features appear to be relict with no evidence of recent inundation
- Ferruginous root channel linings appear to be relict wetland soil features as they are only present in site located at the high water mark which has not been inundated recently (Figure 1)
- Gley colours near the waters edge indicate a permanently saturated and reduced environment (Figure 2)
- No significant organic carbon content was measured at any sites sampled, the area lacks significant vegetation growth necessary to form an accumulation of organic materials

Figure 1. Ferruginous root channel linings

These provide reliable evidence of plant growth in a saturated environment where the root has pushed oxygen into the saturated soil, forming a coating of ferric iron around the root channel

Figure 2. Gley soil colours

When a soil is exposed to an anaerobic environment ferric iron (Fe III) in the soil is quickly reduced to the colourless and mobile ferrous iron (Fe II)

This gives the soil a characteristic grey/green/blue colour known as “gley”
